Directions for Quizzes
Physics 123
Independent Study
Brigham Young University

There is a closed-book quiz at the end of each lesson. The questions in the quizzes are multiple choice and do not require any calculations. On the average, each quiz contains about 9 questions.

Preparation
• Be sure to work all of the assigned problems before you take the quiz. You will not be allowed to submit any additional answers once you have downloaded the quiz. You will also not be allowed to take the quiz unless you have correctly completed at least half of the assigned problems.
• Look at the study guide at the beginning of the lesson. Be sure that you can do the tasks listed in the study guide without referring to the textbook or your notes.
• The mastery of physics requires more than mere memorization of equations and explanations. You must also understand the material. Many of the quiz questions will attempt to test your true understanding of the material. Think about the material in the lesson, and review sections in the textbook where you sense your understanding may be weak.

Taking the quiz
• Download the quiz and print a copy.
• Do not read the quiz questions until you are ready to take the quiz.
• Do not use the textbook or any notes during the quiz.
• There is no time limit on the quiz, but you should take it in one sitting without any long interruptions.
• After finishing the quiz, enter the answers over the internet. They will be immediately graded. You will see which questions you missed and what the correct answer should have been. You will see some comments about each question. You will also see your total score for the lesson (problem assignment and quiz scores combined).
• After the quiz is graded, you may proceed to the next lesson.
